

Stable case ( $N^2 = \text{constant} > 0$ ); can solve set analytically.

2. As before, use new variables:

$$M \equiv R^3 w, \quad V \equiv R^3, \quad F \equiv R^3 B.$$

At  $t = 0$ :  $m = v = 0, \quad F = F_0 \left(=\frac{3Q}{4\pi}\right),$   
where

$$Q = \iiint B_0 d\zeta.$$

3. Render dimensionless (the resulting eqs.)

skip

$$\left\{ \begin{array}{l} F^* = F_0 f \\ m^* = \frac{3}{4\pi} F_0 N^{1/4} m \\ v^* = \left(\frac{3}{\pi}\right)^{3/4} \alpha^{3/4} F_0^{3/4} N^{-3/2} v \\ t^* = N^{-1} t \end{array} \right. \quad * \text{ dimensional}$$

Obtain dimensionless forms of gov. eqs. (see text,  
Eqs. (2.7.19) - (2.7.21)).

Can get ht. of thermal from  $\lambda dz/dt = w$ .

Scale  $z$ :

$$\frac{M^*}{V^*} t^* = z^* = \frac{1}{4} \left(\frac{3}{\pi}\right)^{1/4} \alpha^{-3/4} F_0^{1/4} N^{-1/2} z$$

$$= w^* t^*$$

Recall that  $w^* = M^*/V^*$ , so  $w = m/v$  (non-dim.),  
as expected,

$$\frac{dz}{dt} = \frac{m}{v} \quad (\text{non-dim.}) \quad (2.7.22)$$

4. Apply b.c.s to solve

Sols. for  $R, w, B$  are obtained, with new b.c.s, sequentially for each segment of upward and downward motion, i.e., for  $0 \leq t \leq \pi$  (non-dim.);

$$z = 4(1 - \cos t)^{1/4}$$

(see text for others).

H.W. - Do exercises 2.1-2.4  
For 2.3, use  $d = 0.093$ .

## 2.8 Experiments and observations

In analytic solutions, as well as numerical ones,  $\alpha$  remained an undetermined constant, to be somehow determined from experiment.

For alternate approach (P. 5)

Plumes in a stable stratification can be used because the lower part of the plume is essentially the same as that of a similar plume when  $N^2 = 0$ , (see Figs. 2.7).

2.9

From measured heights of a plume in a stable stratification plotted vs.  $F_0^{1/4} N^{-3/4}$  as in Figs. 2.10, we can determine the constant  $\alpha$ , since we saw in §2.7 that  $h_t$  depends only on  $\alpha$ ,  $F_0$ , and  $N$ .

Specifically, for a plume,  
$$z = 0.410 \alpha^{-1/2} F_0^{1/4} N^{-3/4} z^* \quad (\text{p. 30})$$
 where  $z$  is the <sup>n.d.</sup> ht. of some feature, such as max. plume ht., and  $z^*$  is dimensional ht. (measured).

We found that  $z = 2.8$  at plume top, so

$$z^*/(F_0^{1/4} N^{-3/4}) = 0.410 \alpha^{-1/2} (2.8).$$

Actual slope is 3.79, so  $\alpha = \frac{3.79}{2.8 \times 0.410}$

$$\alpha = \left( \frac{2.8 \times 0.410}{3.79} \right)^2 = 0.092.$$

Similarly, for a thermal,  
$$z^* = \frac{1}{4} \left( \frac{3}{\pi} \right)^{1/4} \alpha^{-3/4} F_0^{1/4} N^{-1/2} z \quad (\text{p. 33})$$

Ultimate n.d. ht. is  $z = 4.2$ . For  $z^*$  vs.  $F_0^{1/4} N^{-1/2}$ ,  
 Slope =  $\frac{1}{4} \left(\frac{3}{\pi}\right)^{1/4} \alpha^{-3/4} (4.2) = 2.66$  from exp.  
(Fig. 2.11), SD  $\alpha^{-3/4} = 2.66 / \left(\frac{1}{4} \left(\frac{3}{\pi}\right)^{1/4} 4.2\right) = 2.5627$   
 $\alpha = (2.5627)^{-4/3} = 0.285,$

### Alternate approach for plume to derive $\alpha$ :

Assume a radial profile of  $\exp(-pr^2/z^2)$ .

Then slope of ht. of plume top vs.  $F_0^{1/4} N^{-3/4}$   
 depends on  $p$ , (see Fig. 2.10),

Determine  $p$  experimentally as best fit  
 to measurements,

### Relate $p$ to $\alpha$ as follows:

Equate assumed radial dependence,

$$\exp(-r^2/R^2)$$

to

$$\exp(-pr^2/z^2).$$

Then

$$\frac{R}{z} = p^{-1/2} = \frac{6}{5} \alpha$$

according to solution for plumes with  $N^2=0$ .

(See discussion on p. 4 for why we can  
 apply this result to stable stratification.)

From Fig. 2.10,  $p = 80$  is best ~~choice~~ <sup>match</sup>.

$$\text{Then } \alpha = \frac{5}{6} p^{-1/2} = \frac{5}{6} (80)^{-1/2} = \underline{0.093},$$
